20<sup>th</sup> century science discovered that the physical world is deeply relational. In fact, the phenomenon of quantum entanglement implies that even the subatomic world cannot simply be treated atomistically. With that in mind, 13 distinguished scholars from physics and theology including John Polkinghorne, Michael Heller and Michael Welker explore the role of relationality in both science and religion.

This volume provides careful assessment of the significance that these insights have for the interdisciplinary discussion of a consonant relationship between science and religion. *The Trinity and an Entangled World* offers an authoritative and illuminating discussion and will prove to be an important contribution to the literature concerned with science and religion.
